NEW AND IMPROVED KIT SPECIFICATIONS

In addition to developing technologically advanced friction formulations and designs for the latest commercial vehicle applications, Jurid engineers continually monitor industry feedback related to existing OE brake system designs and Jurid products as part of Jurid's continuous improvement and product evolution approach.

In keeping with our commitment to provide powerful, reliable, efficient, and safe braking in across a wide range of applications, our engineering team has introduced an updated design for Jurid Brake Pad Kit 2941509560 for the Haldex DBT22LT brake system. This updated design is intended to simplify pad installation and support proper assembly during service operations.

The new, updated Jurid 2941509560 Kit (see illustration below) features an interlocking retention spring ("S") designed to facilitate installation and provides consistent pressure on the walls of the hold-down hole/seat ("H"). Further, this updated design enables the brake technician to visually check pad retention from all angles, supporting proper assembly.
